Raw Font Tables

Scott Pakin, *scott+clsl@pakin.org*

5 May 2021

This document presents, in alphabetical order, font tables for all of the fonts that appear in the *Comprehensive LaTeX Symbol List*. It was mechanically produced using a script that extracts the list of fonts used by the *Comprehensive LaTeX Symbol List* and feeds this list into Knuth's `testfont.tex`, which is included in all TeX distributions and can typeset font tables. The purpose of this document is to provide a companion mechanism for locating symbols by organizing the myriad symbols available to TeX and LaTeX by font family rather than by LaTeX symbol name. It may also reveal some unnamed symbols—or symbols overlooked by the *Comprehensive LaTeX Symbol List*.

On the other hand, not every symbol shown in the *Comprehensive LaTeX Symbol List* appears in this document. Some symbols are defined by juxtaposing multiple other symbols; some symbols are defined in terms of graphics primitives instead of fonts. The tables shown in this document are only those that correspond to "true" fonts—glyphs drawn in METAFONT, PostScript, or other such font formats and that have an associated TeX font metric (`.tfm`) file.

In each table, characters are numbered in both base 8 (octal) and base 16 (hexadecimal). A character's octal position is formed by taking the first two octal digits from a table's left column and the third octal digit from the top row. A character's hexadecimal position is formed by taking the first hexadecimal digit from a table's right column and the second hexadecimal digit from either the top or the bottom row, based on whether the character lies in the upper or lower row associated with the first hexadecimal digit. To clarify this description with an example, the "△" symbol in the `cmsy10` table can be produced by either `\char'064` (octal) or `\char"34` (hexadecimal). The "ℜ" symbol that lies directly beneath that in the table can be produced by either `\char'074` (octal) or `\char"3C` (hexadecimal). The decimal equivalents of these are `\char52` and `\char60`, and their character equivalents are "`4`" and "`<`", respectively.

To put this means of character usage in contact, suppose we want to typeset `\sqiiint` ("⨌") from the txfonts package. txfonts is a large package that redefines all text and math fonts, which may not be desirable just to typeset a single symbol. The following is how we employ a single txfonts symbol without having to load the entire package.

We observe that the symbol in question is character 52 hexadecimal (or 122 octal) in the `txexa` table in this document. The first step is to associate `txexa` with a TeX control sequence; here we call it `\myfont`:

```
\font\myfont=txexa at 10pt
```

(If our document were typeset in a font size other than 10 pt., we would specify that size in the above.) We then define a macro, here `\mysqiiint`, that sets the font and typesets a single character:

```
\newcommand*{\mysqiiint}{{\myfont\char"52}}
```

The extra pair of curly braces in the above limit the font change to the single character we want to typeset. We can now use `\mysqiiint` without having to load the txfonts package.

Alas, in this case the symbol winds up being typeset below the baseline. This is an artifact of typesetting a mathematical symbol outside of math mode. The solution is to explicitly raise the symbol to the desired height:

```
\newcommand*{\mysqiiint}{\raisebox{10pt}{\myfont\char"52}}
```

Note that the amstext package's `\text` command is a useful mechanism for typesetting text characters in math mode.

A
