Using LuaLaTeX to typeset RTL text with reledpar

Abstract

This file provides an example of how to use reledpar and LuaLaTeX to typeset a right to left text with its translation on the facing page[1].

As you can see, the switch to RTL convention is made *before* the `pstart`. It must be also called inside `\eledsection`.

For an example with XeLaTeX, look at parallel-column-two-languages.tex file.
